## ABSTRACT:

PROBLEM TO BE SOLVED: To obtain the subject composition having a substantial feeling in use without utilizing a surfactant by using both a specific polymer and a prescribed oily component as an emulsifying means and setting the particle diameter of the oily component of an inner phase at a fixed value or lower than it.

SOLUTION: Both (A) an alkyl-modified carboxyvinyl polymer (especially preferably an acrylic acid-methacrylic acid alkyl copolymer) and (B) an oily component in a solid state at a room temperature (especially preferably a higher alcohol, solid oils and fats, a wax, a solid hydrocarbon, a higher fatty acid and its salt) are used and the number-average particle diameter of the oily component of an inner phase formed by emulsification is made  $\leq 1\mu\text{m}$ . The amount of the component A blended is preferably  $\geq 0.01\text{wt.}\%$  and  $\leq 10\text{wt.}\%$ , especially  $\geq 0.05\text{wt.}\%$  and  $\leq 5\text{wt.}\%$  based on the total of the composition. The amount of the component B blended is preferably  $\geq 0.05\text{wt.}\%$  and  $\leq 20\text{wt.}\%$ , especially  $\geq 1\text{wt.}\%$  and  $\leq 10\text{wt.}\%$ . The component composition is preferably emulsified by using a nonaqueous emulsification method, a D-phase emulsification method or a phase inversion temperature emulsification method.

ABSTRACTED-PUB-NO: JP09255529A

BASIC-ABSTRACT:

Oil in water type emulsified composition has an average particle size of at most 1  $\mu$  m of the oily component and contains (A) alkyl degenerated carboxyvinyl polymer, particularly alkyl acrylate/methacrylate copolymer, especially at concentrations of 0.01-10 (preferably 0.05-5) wt.% and (B) an oily component solid at room temperature, particularly at concentrations of 0.5-20 (preferably 1-10) wt.%.

USE - The composition is used as a cosmetic base.

ADVANTAGE - The composition is safe and stable at low temperature. In an example, an emulsion comprising an oily phase of 15.0 wt.% of liquid paraffin, 1.0 wt.% each of dimethylpolysiloxane and stearic acid, 4.0 wt.% of stearyl alcohol and an aqueous phase of 0.2 and 0.1 wt.% each of 2 types of alkyl degenerated carboxyvinyl polymers, 10.0 wt.% of glycerine, 1.0 wt.% of ethanol, 0.5 wt.% of methyl p-hydroxybenzoate and balance deionised water gave good feeling and stability at low temperature.

CHOSEN-DRAWING: Dwg.0/2
